What is GitHub Copilot modernization?

GitHub Copilot modernization is an AI-powered agent that helps modernize applications end to end. It upgrades runtimes and frameworks, migrates applications to Azure, improves security, and guides you through every stage of the process including assessment, planning, code transformations, validation, and deployment. It supports Java, Python, and .NET with integrated Azure migration workflows.

Note:

GitHub Copilot Modernization can be used with just a GitHub account—an Azure account is only required when you actually deploy or test Azure-specific modernization patterns.

What's New:

All features from the [Java Upgrade Assistant](#) extension have been merged into this extension. Java version upgrades, Java framework upgrades, and Azure modernization are now available in one place. If you have the Java Upgrade Assistant installed, it is no longer needed and has been deprecated — you can safely uninstall it.

Key capabilities

Assessment

Copilot evaluates your project's readiness for modernization. It analyzes code, configuration, and dependencies, identifies outdated libraries and frameworks, and highlights areas that may require additional remediation before you proceed.
